

Bio Stimulant - Larixifol

Larixifol was launched in 2016 as a liquid emulsion concentrate and is already making headway as a preferred seed treatment in the upper Midwest being used on more than 50,000 acres of corn and soy beans. This environmentally-friendly product is a naturally-occurring taxifolin derived from a larch tree concentrate. Larixifol protects many different seeds and plants from extreme temperatures and drought and is popular as a foliar spray on turf, crops and also as an additive for cut Christmas trees. In Rockford, Illinois field trials in 2017, it held its own against well-known seed treatments such as Cruisermax and it was one of the first plots to emerge after planting amongst intense competition including Quikroots, Cruisermax, and many gibberellic acid-based products.
